## Introduction

Each detection point of your fixed gas monitoring system consists of a transmitter and a controller GMA44. The GMA44 allows to connect up to four transmitters of the same type. Transmitters and GMA44 are connected by means of transmitter cable. The GMA44 provides the power supply for the connected transmitters and receives and processes the sensor signals. Depending on the transmitter type, it monitors the ambient air for the presence of toxic or combustible gases and vapors or for its oxygen content. The GMA44 offers a variety of features, which allow for adapting the gas monitoring system to your specific requirements:

- 3 digit display of the linear measurement values.
- Menu display.
- 3 variably adjustable alarm thresholds.
- Adjustable relay functions: NC/NO contacts, closed circuit or open circuit operation.
- Alarm hysteresis prevents "relay flattering".
- Activation / Deactivation of specific measurement channels

The GMA44 continuously provides information on the measured gas concentration, exceeded alarm thresholds and its operational status. As soon as the gas concentration at one of the connected transmitters exceeds one of the three pre-set levels, the GMA44 gives a warning by means of the LED displays and controls the relevant alarm relays.

The GMA44 is easy to operate and maintenance-free. Should unexpected failures or system faults occur, the automatic failure recognition of the GMA44 allows a quick and specific service.

# **Application**

In combination with one or up to four transmitters the GMA44 forms a fixed gas warning system for "quasicontinuous" monitoring (see section detection mode) of gas concentrations in ambient air and warning from combustible gases and vapors in the LEL range, toxic gases and oxygen.

# Distinguishing the Types of GMA44

GMA Type		Built-in 230V	Supply voltage	Bus system
	Transmitter Type	mains unit		
GMA44	all	no	24 V DC	no
GMA44 EC	EC 24, EC 25 (0.21 mA)	yes	230 V AC / 24 V DC	no
GMA44 B	all	no	24 V DC	yes
GMA44 ECB	EC 24, EC 25 (0.2 1 mA)	yes	230 V AC / 24 V DC	yes

The voltage supply of the controllers GMA44 EC and GMA44 EC B are specially designed for operating an electrochemical sensor. For all other transmitters you have to use the controllers GMA44 or GMA44 B. The pluggable bus system of the controllers GMA44 B and GMA44 EC B allows to easily interlink several GMAs. The following signals are fed in the bus system:

- 24 V supply voltage
- Signal for alarm 1, alarm 2, alarm 3, fault

The key-operated switch can only be operated in combination with the GMA44 B or GMA44 EC B.

# For your Safety

According to § 3 of the law about technical working media, this manual points out the proper use of the product and serves to prevent dangers. This manual must be carefully read by all individuals who have or will have the responsibility for using and servicing this product. As any piece of complex equipment, the GfG GMA44 will do the job designed to do, only, if it is used and serviced in accordance with the manufacturer's instructions. The warranties made by GfG with respect to the product are voided, if the adjustment of functions or parameters is changed without GfG's permission. They are also voided, if the product is not used and serviced in accordance with the instructions in this manual. The above does not alter statements regarding GfG's warranties and conditions of sale and delivery.

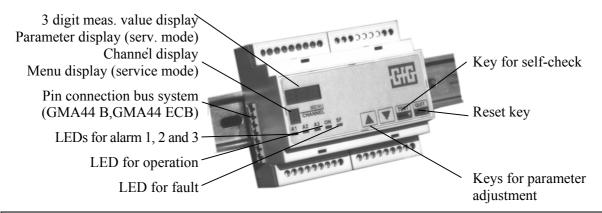

### **Essential Notice:**

For the parameter setting of the supplied GMA44 please refer to the test report. Modification of functions or parameters may affect the approval. GfG service is always at your disposal for adapting the monitoring system to your specific requirements.

# **Detection Mode**

#### **Front View GMA44**

#### **Function Description**

#### **Turning On**

According to UVV Gase, the GMA44 has to be put in operation by an expert. After having turned the system on, allow a few minutes for:

- the self test, which checks functions, memory (ROM and RAM) and parameter memory (approx. 10 seconds),
- the warm-up of the transmitters connected (for detailed information please refer to the operation manual for your transmitter).

During the warm-up period the GMA44 displays the detection range, the detection unit and the alarm thresholds one after the other. The LED "**ON**" blinks and the LED "**S F**" is lit, i.e. the fault alarm is active. There are no gas alarms during the warm-up period. When the GMA44 re-starts after a mains failure, the gas alarms are only evaluated, once the warm-up is completed. Then the GMA44 automatically turns to detection mode.

#### **Detection Mode**

During the detection mode the activated 3 digit LED display shows the current gas concentrations of the individual transmitters one after the other (the display of the measurement values can get deactivated. Please ask for GfG's Service). The channel display indicates, which transmitter is displayed. All channels are monitored quasi-continuously (VDE DIN 50271 4.1.3. Detection mode: During the detection the maximum time between four successive actualizations of the detection value may not exceed the respective response

time t90 of the gas monitor, or for pure warning devices, the time up to the activation of an alarm.). Exceeded threshold values are recognized and reported immediately. Electronic functions, like parameter memory and transmitters, are continuously monitored. In trouble-free detection mode the green LED "**ON**" is lit and the yellow LED "**S F**" is out.

#### Check of Display, Parameter and Relays

During this check the measurement and warning function is <u>not</u> activated!

#### **LED Test**

In detection mode, press key shortly to activate the self-test of the GMA44 controller. A successful self-test is indicated by the flashing of all LEDs.

#### **Display of Detection Range and Alarm Thresholds**

Keep key TEST pressed for approx. 5 seconds. The LED "ON" blinks and the display reads the below mentioned parameters one after the other:

	Display, e.g.	LED ON - blinks, additionally lit:	Description of Display
1	100, 50, 10		Detection range
2	UEG, LEL, ppm, ppb		Unit of gas
3	CH <sub>4</sub> , NH <sub>3</sub> , O <sub>2</sub>		Gas
	GfG-Gas No.		
4	20 (value in det. range)	<b>A</b> 1	1. Threshold alarm
5	40 (value in det. range)	A2	2. Threshold alarm
6	40 (value in det. range)	A3	3. Threshold alarm

Once these readings are complete, the GMA44 turns to detection mode automatically.

#### Alarm configuration

The GMA 44 has 3 alarm thresholds.

Max. number of channels	Kind of alarm	Alarm per channel	Assignment
4	Collective alarm	3	alarm 1

The GMA44 provides 3 threshold alarms, which act as a collective alarm for all connected transmitters. An alarm is activated as soon as the gas concentration exceeds or falls below the alarm threshold. An activated alarm is indicated by means of the relevant alarm LED. Press key Quit to acknowledge the alarm. During this time newly activated alarms get acknowledged too.

Alarm	Relevant Alarm LED
has been activated	blinks
has been activated and acknowledged by pressing key NENUT	lights permanently

Together with the alarm LEDs the GMA44 activates the relevant alarm relay and the logical output. The standard setting for the switching functions is shown below:

Alarm	Function	Resettable during Alarm	Resettable after Alarm	Remark
1	non-latching	no	self deleting	
2	latching	no	yes	
3	latching	yes	yes	Same threshold as alarm 2

The switching functions of the three alarms can be set individually. Alarm thresholds and switching functions are the same for all 4 channels. For other settings than the standard one please refer to your test report.

By pressing key \( \bigsim \) during an alarm, the status of the corresponding channel can be seen from the LEDs.

#### During the test the measuring and warning functions are <u>not activated!</u>

#### **Overrange Memory**

In case the detection range is exceeded by more than 10 %, the GMA44 activates the fault indication in addition to the 3 gas alarms. The display reads ————. All alarms and the fault indication are, in this case, latching, i.e. they can only be reset by pressing key when the gas concentration has fallen below the full scale value.

The switching functions of the three alarms can be set individually. Alarm thresholds and switch function are the same for all 4 channels. For settings, which are different from the standard adjustment, please refer to the test report.

#### **Remarks concerning Alarm Functions:**

#### **Exceeding / Deviating Alarm**

If the reduction of the measured gas concentration means a hazardous situation, e.g. oxygen deficiency, the alarm is a deviating one. Exceeding alarms indicate a dangerous situation caused by rising gas concentrations, e.g. toxic and combustible gases.

#### Latching / Non-latching Alarm

A latching alarm remains valid until it is reset externally, e.g. by pressing key very at the GMA44. By pressing key very an activated alarm is, after having passed all measurement channels, acknowledged. During this period newly activated alarms are being acknowledged as well. A non-latching alarm resets automatically, when the gas concentration falls below or exceeds the preset threshold.

#### **Fault**

In case of failure the yellow LED "**S F**" lights up and the fault relay is activated. A fault is signalized:

- if the cable between transmitter and GMA44 is cut;
- if the sensor or the circuit of the transmitter is faulty;
- if the zeropoint is deviated;
- if the detection range is exceeded (together with alarm activation);
- if the CPU self monitoring is faulty.

As soon as the fault is over, the yellow LED "SF" goes out. The fault relay switches back and the controller goes back to the normal operation.

# Relays

The GMA44 provides 4 relays:

- 3 alarm relays for controlling external alarm devices,
- 1 fault relay for signalizing of failures.

The switching behavior of the relays is the same as for alarm or fault signals. Every relay can be operated as NC or NO contact in closed or open circuit systems. For the switching functions as NC and NO relays you will find contact clamps. In the standard setting all 4 relays are NO contacts. The alarm relays are operated as open circuit system, the fault relay is a closed circuit.

#### In the standard setting the switching functions of the relays are as follows:

	The relay switches:							
Relay for:	in detection mode (no gas)	during g not reset	as alarm reset	after ga not reset	s alarm reset	in case of mains failure	in case of failure	in case of gas alarm and failure
Alarm 1	Ö	⊸ö ⊸s	~~ö ⊸s	Ö	Ö Ös	Ö –os	Ö Ö S	Ö
Alarm 2	Ö	⊸ö ⊸s	~ Co Co Co Co Co Co Co Co Co Co Co Co Co C	~~ö ⊸s	Ö Ös	Ö –os	Ö –os	Ö S
Alarm 3	Ö	⊸ö ⊸s	Ö	~~ö ⊸s	Ö	Ö –°S	Ö –os	Ö
Fault	⊸ö ⊸s	⊸ö ⊸s	~ Co Co Co Co Co Co Co Co Co Co Co Co Co C	~~ö ⊸s	~ Ö ⊸s	Ö –os	Ö –os	Ö Ö S

 $\ddot{O} = open$ S = closed

It is essential to take notice of the switching behavior of the relays when connecting external devices. In the standard setting alarm 3 (buzzer relay) can be reset even during gas alarm!

For special settings of the relay switching functions please contact your GfG service.

## **Service**

#### **Display of Sensor Signal**

Press key  $\nabla$  for approx. 2 seconds, and the GMA44 display reads the signals, coming from the transmitter, in mA (0,2 .. 1 for transmitters with 0,2 .. 1 mA output and 4 .. 20 mA for transmitters with 4 .. 20 mA output). You will always see only that channel, which was displayed when you pressed the key. This channel is kept until you release key  $\nabla$ . This function allows to check the zeropoint of the connected transmitters quickly and easily at the GMA44.

### Recognition of the service mode of a transmitter

This function is only supported by the transmitters CC 24 EX (type 243x II), CS 24 EX (type 247xII) and EC 25 (type 250x).

The transmitter CC 24 EX, CS 24 EX, EC 25 all have a service switch. If this switch is pressed for service operations (see manual of the transmitter), the GMA 44 displays a fault alarm. No alarms are passed on.

#### **Activation of Service Mode**

The service menu allows for displaying and changing of all important parameters of the GMA 44.

A security code protects the service mode A and B from accidental maladjustment and unauthorized access. Adhere to the following procedure to enter the service mode:

- 1. Press key MENU, then key TEST and keep both keys pressed, until "SER" is read in the display.
- 2. Use keys  $\triangle$  and  $\overline{\lor}$  to enter the security code.

	<b>Security Code</b>	Adjustments
Menu A	11	Alarm thresholds and adjustment
Menu B	222	Deactivation points of alarm thresholds

3. Press key NENUT to confirm the entered security code.

The GMA44 turns to service mode

or

Press key TEST to return to detection mode.

In the service mode the gas alarms are locked, new alarms cannot be activated. The GMA44 switches to fault. The LED " $\mathbf{ON}$ " and " $\mathbf{SF}$ " light up, the fault relay is activated

#### Adjustments in Service Mode

The display of the GMA44 reads the set parameters. The menu display indicates the menu point, where the displayed parameter value can be found. Use keys NENUL and NENUL to scroll forward and back. For changing of parameters use keys \( \triangle \) and \( \forall \).

#### **Survey of Menu Points**

Menu A				
Menus display	Channel	Description	Display, e.g.	Parameter Setting
r ¦		Relaytest	r1	

#### The menu starts with "G1"

<u>[]  </u>	all	Measurement unit	LEL, ppm	Only display
08	all	Gas	CH <sub>4</sub> , NH <sub>3</sub> , O <sub>2</sub> or GfG-Gas No.	
8 :	all	Threshold alarm 1	Value in detection range	
82	all	Threshold alarm 2	Value in detection range	Adjustment with
83	all	Threshold alarm 3	Value in detection range	△ and ▽
0/1,2,3,4	1 to 4	Zeropoint adjustment	0 *	
0/1,2,3,4.	1 to 4	Sensitivity adjustment	Value in detection range *	

<sup>\*</sup> Parameter display --- if channels are activated. Adjustment of parameters is not possible.

Menu B				
Menus display	Channel	Description	Display, e.g.	Parameter Setting
8:	all	Point of deactivation for alarm 1	Value in detection range	
82	all	Point of deactivation for alarm 2	Value in detection range	Adjustment with
83	all	Point of deactivation for alarm 3	Value in detection range	△ and ▽
[/], 2, 3, 4	1 to 4	Activation of channel	on	
	1 to 4	Deactivation of channel	off	$\overline{\nabla}$

### Adjustments in service menu A

#### **Setting of Alarm Thresholds**

- 1. Activate the service mode A.
- 2. Use keys TEST and NENUY to select menu point [A, B, B] or [A, B, B] for the alarm threshold to be set.
- 3. Set the new alarm threshold by means of keys  $\triangle$  and  $\nabla$ .
- 4. Store the parameters. (see page 13)

#### Check and adjustment of Zero point

- 1. Supply zero gas to the transmitter or make sure, that the ambient air is free from interfering gases. Zero gas is a test gas, which is free from combustible or any other interfering components. For details about the gas supply please refer to the operation manual of your transmitter.
- 2. Wait until the display value is stable. Then press key  $\boxed{\lor}$  for 2 seconds to check the sensor signal. An adjustment of the zero point is only possible, if the sensor signal is within a tolerance band:

For a transmitter with 0.2 - 1 mA: Tolerance of 0.15 - 0.34 mA For a transmitter with 0.4 - 20 mA: Tolerance of 3 - 6.8 mA (Slightly different tolerances are possible).

If the zero-point is out of tolerance, the zero point has to be adjusted at the transmitter first. For this, please read the manual of the transmitter.

- 3. Activate the service mode A.
- 4. Use keys TEST and MENU to select menu point of the current channel.
- 5. Press key for 3 seconds to adjust the zero point automatically. The adjustment of the zero point was successful, when the value "0" is flashing in the display. If the display is not flashing, the sensor signal was out of tolerance and has to be adjusted at the transmitter first. Please refer to the operation manual of your transmitter.
- 6. Disconnect the zero gas from the transmitter. In case of transmitters for oxygen wait until the displayed gas concentration exceeds the threshold alarm.
- 7. Store the parameter (see page 13).

#### Check and adjustment of sensitivity

**Note:** Before you can check the sensitivity, make sure that the zeropoint is set correctly.

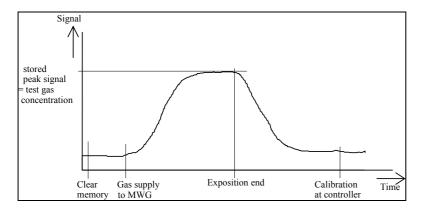

The GMA 44 allows for the check and adjustment of sensitivity with the help of the peak value memory. The memory activates itself, after the menu setting of the respective channel has been activated for at least 2.5 minutes. The GMA 44 displays the activated peak value memory by a flashing display.

#### Check and adjustment of sensitivity without peak value memory

- 1. Activate the service mode A.
- 2. Use keys TEST and MENU to select menu point of the current channel.
- 3. Supply test gas to the transmitter. For details about the gas supply please refer to the operation manual of your transmitter.
- 4. Wait until the display value is stable.
- 5. Use keys  $\triangle$  and  $\nabla$  to set the parameter value to the concentration of your test.
- 6. Disconnect the test gas supply from the transmitter. In case of transmitters for toxic or combustible gases wait until the displayed gas concentration falls below the threshold alarm.
- 7. Store the parameter (see page 13).

#### Check and adjustment of the sensitivity with peak value memory

This adjustment method uses the possibility of the GMA 44, to store the highest signal value, which has been measured during the test gas supply. The stored maximum values can be used as sensitivity point. Figure 2 shows this procedure:

- 1. Activate service menu A.
- 2. Use keys MENU and MENU to select menu point of the respective channel.
- 3. After 1.5 minutes supply test gas to the transmitter and make sure that the gas is supplied constantly for at least 3 minutes For details about the gas supply please refer to the operation manual of your transmitter.

The test gas supply needs to be done timely before the starting the storage. Thereby wrong measurement values through the increase in pressure when opening the pressure gauge of the test gas bottle are avoided. For further detail concerning the gas supply of the transmitter please refer to the manual of the connected transmitter.

- 4. Disconnect the test gas source from the transmitter.
- 5. Use keys and to set the parameter value to the test gas concentration.
- 6. Store the parameter (see page 13).

#### Adjustments in service menu B

#### Alarm threshold hysteresis

This function allows for adjusting the hysteresis (point of deactivation) of the alarm thresholds. For exceeding alarms this point can be set from the start of the detection range up to two digits below the alarm threshold. For deviating alarms the deactivation point can be set from two resolution units above the alarm threshold up to the end of the detection range. The parameter setting is done in the unit of the gas to be measured.

#### Example:

The hysteresis of a controller, which monitors gas in the LEL range, was set to 18 % LEL for alarm 1, 36 % LEL for alarm 2 and 54 % LEL for alarm 3. This results in the alarm activation below:

	Alarm 1	Alarm 2	Alarm 3
Alarm threshold	= 20 % LEL	= 40 % LEL	= 60 % LEL
Alarm activation	≥ 20 % LEL	≥ 40 % LEL	≥ 60 % LEL
Alarm deactivation	≤ 18 % LEL	≤ 36 % LEL	≤ 54 % LEL

#### Adjustment of deactivation point:

- 1. Activate service menu B.
- 3. Use keys  $\triangle$  and  $\nabla$  to adjust the new deactivation point.
- 4. Store the parameter (see below).

#### **Activation / Deactivation of different channels**

With this function different channels can be activated or deactivated. This makes sense, if a defect transmitter needs to be taken out of the monitoring system for inspection or if, for the time being, only 2 measurement points shall be established and only later further measurement points shall be activated.

#### Activation / Deactivation

- 1. Activate service menu B.
- 2. Use keys MENUA and MENUA to select menu point for the respective channel , or or or
- 3. The desired channel gets activated with key  $\triangle$  and deactivated with key  $\nabla$ .

A deactivation of all channels is not possible. At least one channel is always activated.

4. Store the parameter (see below).

#### **Storing of Changed Parameters and Leaving the Service Mode**

All changes done in the service mode have to be stored:

- 1. Press keys TEST and QUIT simultaneously to activate the memory function. The display reads "Sto".
- 2. **Confirm storage:** Press key very to confirm the storage of the parameter. The GMA44 stores all changed parameters and returns to detection mode.

When you store the changes when leaving menu B, all activated alarms and fault reports are deleted.

<u>or</u>

**No storage:** Press key TEST and the GMA44 returns to detection mode without storing the changed parameters.

You can change several parameters one after the other, without storing them individually. Once you have set all parameters, one storage confirmation is sufficient to store all changed parameters.

#### Maintenance

According to the "Guidelines for Explosion Protection", "UVV Gases" and DIN 31051, "maintenance" stands for maintenance, inspection and repair of gas warning equipment. Appropriate measures are described in the information sheet T 023 of BG Chemie. The function test must be done before putting into operation and at least once a year, and checks:

- the zeropoint and the sensitivity (calibration)
- the response time
- the activation of gas and fault alarms

This test has to be done by an expert, and a written result must be filed.

#### Service, Inspection, Calibration and Adjustment

During the inspection visual checks shall be carried out (see information sheet T 023, section 8.1).

- Pollution by dust
- Condensation by humidity
- Protective casing of transmitters
- Diffusion inlets of transmitter

Service and adjustment describe those measures, which retain the nominal status of the gas warning system. Those measures shall be carried out on a regular basis, an interval of 4 months shall not be exceeded (see information sheet T 023, section 8.2, 8.3 and DIN EN 50073, section 6.4.3).

- Zero point
- Sensitivity
- Alarm activation
- Follow-up time
- Audible and visible output
- Fault report

#### **Regular Function test**

In addition to the maintenance the functioning of the controller has to be tested on a regular basis. Intervals of 1 year may not be exceeded. (See information sheet T023, section 8.5 and UVV gases §56)

#### Repair

Repair describes all repair works and exchange of parts. They may only be carried out by the manufacturer or persons who have been authorized by him. Only those original spare parts that have been tested and have been allowed to be sold by the manufacturer may be used.

If these measures are neglected, the safety of the product cannot be guaranteed the type approval is lapsed.

We recommend to regularly carry out function tests and repairs through GfG service.

# **Influence of Interfering Gases and Oxygen**

Interfering gases, oxygen surplus and oxygen deficiency can also affect the measurement of gases at the transmitter. Please adhere to the operation manual of your transmitter.

# **Instruction for Installation and Putting into Operation**

The GMA44 controller must not be installed in hazardous areas. The transmitter and the mains supply are connected according to the terminal diagram. Make sure that the shield of the transmitter cable is already grounded close to the terminals of the GMA44 on the metal mounting plate, e.g. by means of EMC earth clips.

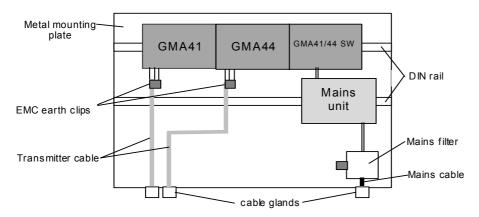

Figure 3: Wiring example

Inside the wall mount casing or the cabinet the transmitter cable should be laid separately from other control and mains cable. The mains supply for the GMA44 is generally to be fed over a mains filter (e.g. FN 610). This filter should also be mounted and grounded on a metal mounting plate close to the cable entry. Once the GMA44 is mounted into a casing and all transmitters, control groups and the mains supply are connected, an expert can put the system into operation. For installation and putting into operation of the transmitters please see the operation manual of your sensor. **Only experts are authorized to put the GMA44 and the transmitters into operation.** 

#### **Transmitter Cable**

The **GMA44** controller and the transmitter are connected by means of a shielded transmitter (data) cable (LIYCY). The cross section of the cable cores depends on the current consumption of the transmitter and on the cable length. For detailed information please refer to the operation manual of your transmitter.

## Accessories

<b>Key-operated Switch</b>	This module allows to control a collective alarm. In addition to this, it
Module:	provides the possibility of alarm suppression, e.g. during service or
	maintenance.

# Remarks concerning the Technical Safety of the GMA44

#### **Contact Protection**

Mains supply and relay contacts of the **GMA44** provide insulation distances of 3 mm, i.e. they are designed for 250 V operational insulation. In case a contact is operated on a contact-critical potential, the contacts close to it are also considered as contact-critical. According to contact protection the contacts are not considered to be separated safely. Resulting from this, the same applies to the relay contacts of a controller operated on 230 V. Here an operational insulation has been provided as well. The insulation of the secondary circuit from the primary circuit and the relay contacts complies with the requirements for contact protection. Distances of 6.5 mm ensure a safe separation. The secondary circuit operates on extra-low safety voltage.

# **Trouble Shooting**

Cause	Solution	
- System error, fault in parameter memory	- Re-start of system - Call GfG service	
- System is in warm-up period, alarm suppression is still active	- Wait until warm-up period is over	
- Faulty voltage supply, defective fuse or mains unit	- Ensure proper voltage supply	
- Incorrect calibration, incorrect zeropoint adjustment	- Adjust the zeropoint, calibrate	
- Display overrange (> 999) - ADC overrange		
- stored overrange	- If there is a gas-free atmosphere at the transmitter, you can reset the stored measurement value	
- Display deviation (< -99) - ADC range deviation	<ul> <li>Check calibration of transmitter and GMA controller</li> <li>Check cable</li> </ul>	
	<ul> <li>System error, fault in parameter memory</li> <li>System is in warm-up period, alarm suppression is still active</li> <li>Faulty voltage supply, defective fuse or mains unit</li> <li>Incorrect calibration, incorrect zeropoint adjustment</li> <li>Display overrange (&gt; 999)</li> <li>ADC overrange</li> <li>stored overrange</li> <li>Display deviation (&lt; -99)</li> </ul>

Ground	20	23	26	29
Signal 420 mA or 0.21 mA	21	24	27	30

## **Technical Data**

Gas Monitor GMA44 for snap-on mounting on DIN-rail

Type: GMA 44

Dimensions: Height: 106 x 90 x 58 mm (WxHxD)

Power supply

Operational voltage: GMA44, GMA44 B 24 V DC

*GMA44 EC, GMA44 ECB* 230 V / 50Hz or 24 V DC

Current consumption: max. 150 mA at 24 V DC

max. 2.6 W at 230 V

Primary fuse: GMA44 EC, GMA44 ECB T 0.08 A G melt fuse

Secondary fuse: GMA44 , GMA44 B T 1.25 A G melt fuse

GMA44 EC, GMA44 ECB T 0.5 A G melt fuse

**Climate conditions** 

for operation: -10 to +55 °C, 0 to 99 % r.h. 700 to 1300 hPa

-10 to +40 °C with built-in mains unit (GMA44 EC and GMA44 ECB)

recommended storage conditions

for GMA44, accessories, spares: -25 to +50 °C, 0 to 99 % r.h.

**Transmitter connection** 

Transmitter: 4 transmitters of the same type and detection range

Transmitter connection: 2-, 3-wire transmitter

Voltage supply output: 18 to 24 V DC

Input signals: 4 .. 20 mA, 0.2 .. 1 mA

**Output signals** 

Display sensor signal: 0.2 ... 1 mA max. deviation: 0.2 ... 0.5 mA  $\pm 0.02 \text{ mA}$ 

> 0.5 mA  $\pm 0.05 \text{ mA}$ 

4...20 mA max. deviation: 4...10 mA  $\pm 0.4 \text{ mA}$ 

> 10 mA + 1 mA

Relays: max. switch voltage 250 V AC 50/60 Hz or 250 V DC

max. switch current 4 A AC/DC

max. switch performance 1000 VA AC or depending on voltage 50 .. 200 W DC

Relay outputs and mains entry are operation insulated

Logical outputs 4 open collector outputs for alarm 1, alarm 2, alarm 3, fault

(only GMA 44B, GMA 44 ECB) Operation only on safety low voltage

Max. switch voltage: 30 V Max. switch current: 100 mA

External reset: High active from 3 .. 24 V DC (input resistance  $11k\Omega$ )

Snap-on bar fixing: DIN EN 50022

Safety

Protection: DIN 40050 - IP -20

Protective separation: by safety transformer

GMA44 EC, GMA44 ECB type: BV EI 306 2064 PRI 230V / SEC 18 V 50 - 60HZ

Protective insulation: as per EN 61010 up to over voltage category III and soiling degree 2

Certificate of manufacturer: The GMA 44 complies with the conditions of the EMC-Regulation 89/336/EWG

and the low voltage regulation 73/23/EWG

## Annex

## Selection of the proper Mains Unit for GMA44 Configurations

The models GMA44 and GMA44 B can only be operated on the stabilized mains unit PS50, or on request with a higher mains unit. The mains unit PS 50 supplies a maximum power of 2000 mA. The chart below allows the calculation of the current consumption for individual monitor configurations. Depending on your specific requirements you have to select a mains unit which is suitable for your task.

- 1. Select your specific monitor configuration (type and quantity of controllers and transmitters).
- 2. Add the individual current consumptions of the controllers and transmitters.
- 3. Compare the result with the chart below and select the suitable mains unit.

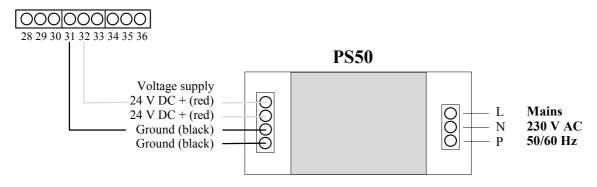

#### Please note:

- GMA44 EC and 44 ECB allow to connect only transmitters type EC24 or EC25.
- GMA44 accepts only transmitters of the same type and for the same detection range.
- Should you use a GMA44, you always have to select the mains unit type PS 50 (or bigger).
- To keep the voltage reduction resulting from the combination of several controllers (≥ 6) as low as possible, make sure that the voltage supply is suitably fed.

	Current consumption [mA]	Qty.	Current consumption x Qty. [mA]			
Controller			-			
GMA44 / 44 B	150					
Key-operated Switch Module (only for B models)	100

	2000 mA	4 <			<b>→</b>	On request

## **Connection Diagram of Mains Units**

#### **GMA 44 Terminals**

The mains unit PS 50 comes complete with  $2 \times 0.5$  m cable red and  $2 \times 0.5$  m cable black, so the supply can be affected at two places.

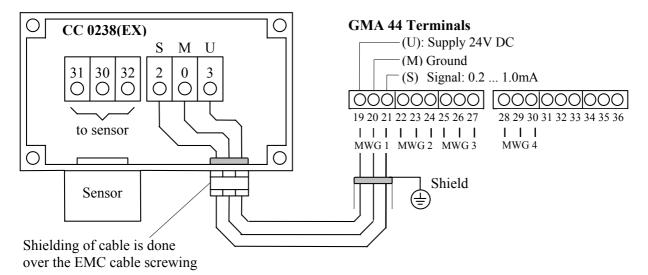

#### **Technical Data of Mains Unit PS50**

Tymo	PS 50		
Type	13 30		
	Stabilized control mains unit		
Dimensions (WxHxD):	225 x 65 x 43.5 mm		
Weight:	464 g		
Input			
Primary voltage:	230 V / 50Hz		
Output			
Secondary voltage:	24 V		
Secondary current:	0 2000 mA		
Power:	max. 50.4 W at 24 V and 2.1 A		
Safety:	Internal overload protection		
<b>Climate Conditions</b>			
for operation:	-10 +55 °C / 20 90 % r.h. / 700 1300 hPa		
Recommended storage conditions:	0 30 °C, 20 80 % r.h.		
DIN rail fixing:	DIN EN 50022		
Safety			
Safety standards:	UL 1950 EN 60950 VDE 0160		

## **Terminal Diagram of Transmitters**

## **Transmitter CC 0238 EX**

The CC sensor is designed as 3-wire transmitter. The supply voltage and the 0.2 - 1 mA output signal use the same ground line. Cable type: e.g. LiYCY 3 x 0.75 mm² (up to 200 m).

MWG = Transmitter

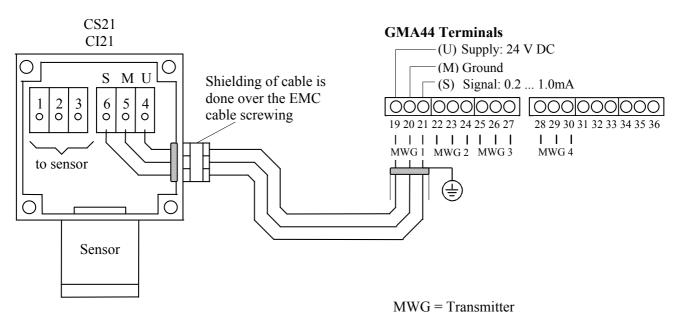

## **Transmitter CS21 and CI21**

These sensors are designed as 3-wire transmitters.

#### 0.2 - 1mA

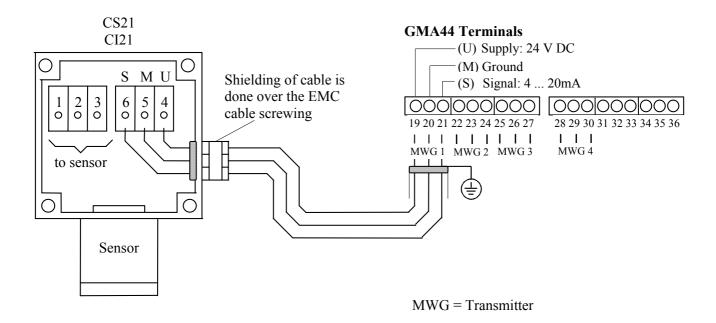

The supply voltage and the 0.2 - 1mA output signal use the same ground line. Cable type: e.g. LiYCY  $3 \times 0.75 \text{ mm}^2$  (up to 200 m)

For connection of transmitters 2 to 4 repeat the steps for transmitter 1 (see picture below).

#### 4 – 20 mA output signal

The supply voltage and the 4-20 mA output signal use the same ground line.

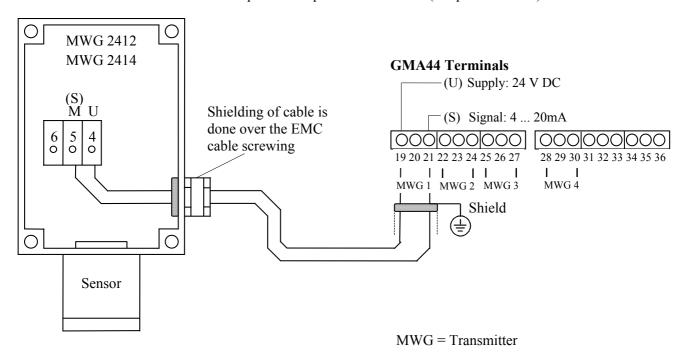

## **Transmitter EC24 (models MWG 2412, 2414, 2411 and 2413)**

#### 4 – 20 mA output signal

The EC models MWG 2412 and MWG 2414 are designed as 2-wire transmitters.

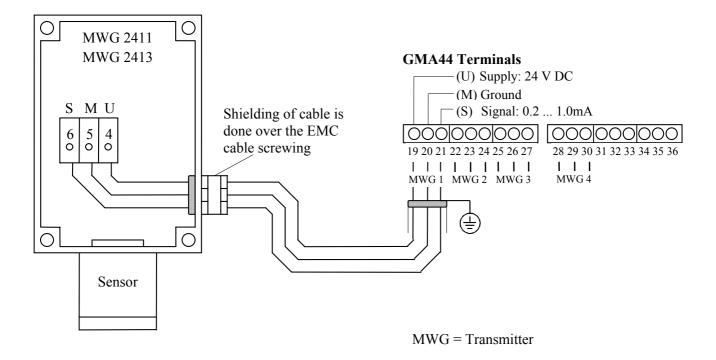

The 4 - 20mA output signal is provided via the supply line.

For connection of transmitters 2 to 4 repeat the steps for transmitter 1 (see picture below).

#### 0.2 – 1 mA output signal

The EC models MWG 2411 and MWG 2413 are designed as 3-wire transmitters. The supply voltage and the 0.2 - 1mA output signal use the same ground line.

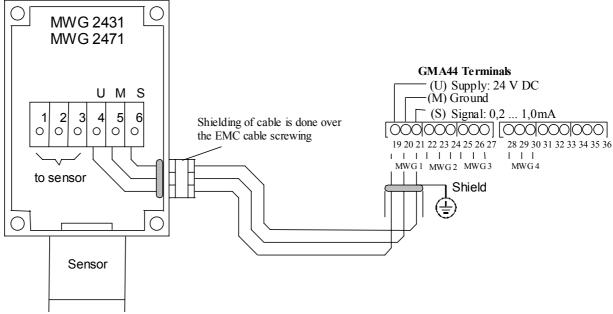

## Transmitter CC24 EX (models MWG 2431 and 2432),

## Transmitter CS24 EX (models MWG 2471 and 2472)

#### 0.2 - 1 mA output signal

The CC sensor MWG 2431, the CS sensor MWG 2471 are designed as 3-wire transmitters. The supply voltage and the 0.2 - 1mA output signal use the same ground line.

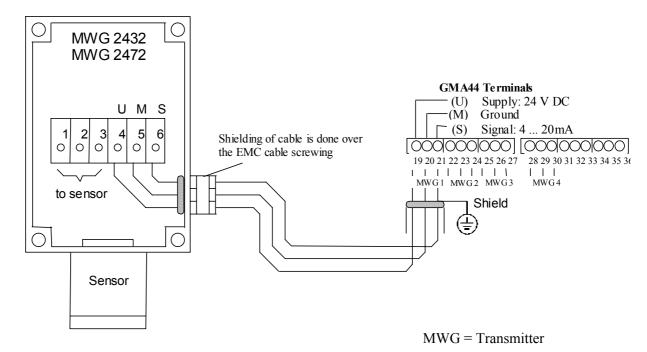

For connection of transmitters 2 to 4 repeat the steps for transmitter 1 (see picture below).

MWG = Transmitter

#### 4 – 20 mA output signal

The CC sensor MWG 2432, the CS sensor MWG 2472 are designed as 3-wire transmitters. The supply voltage and the 4 - 20mA output signal use the same ground line.

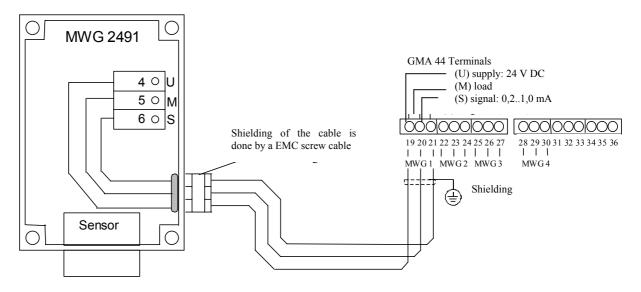

-24-

### Transmitter IR 24 (Type MWG 2491 and type 2492)

#### 0.2 - 1 mA output signal

The IR sensor MWG 2491 is designed as 3-wire transmitters. The supply voltage and the 0.2 - 1mA output signal use the same ground line.

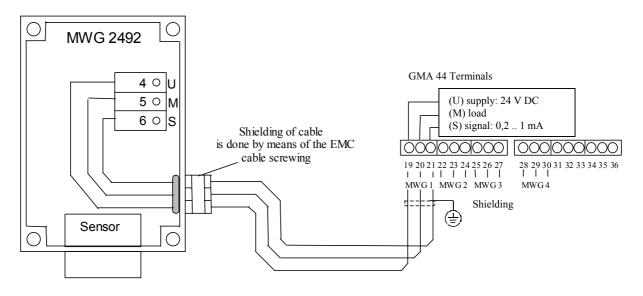

For connection of transmitters 2 to 4 repeat the steps for transmitter 1 (see picture below).

MWG = Transmitter

#### 4 – 20 mA output signal

The IR sensor MWG 2492 is designed as 3-wire transmitters. The supply voltage and the 4 - 20mA output signal use the same ground line.

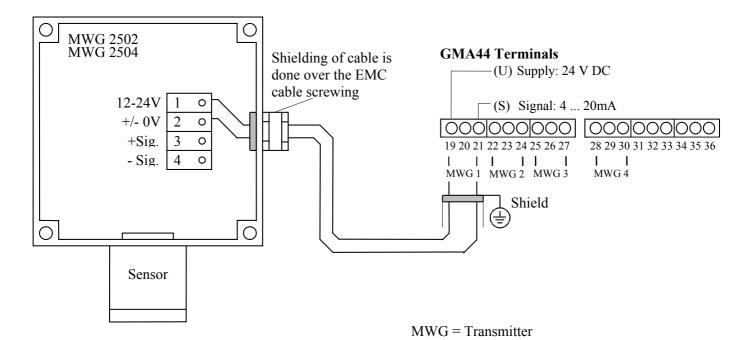

MWG = Transmitter

# Transmitter EC25 (models MWG 502, 2504, 2501 and 2503) without Exbarrier

#### 4 – 20 mA output signal

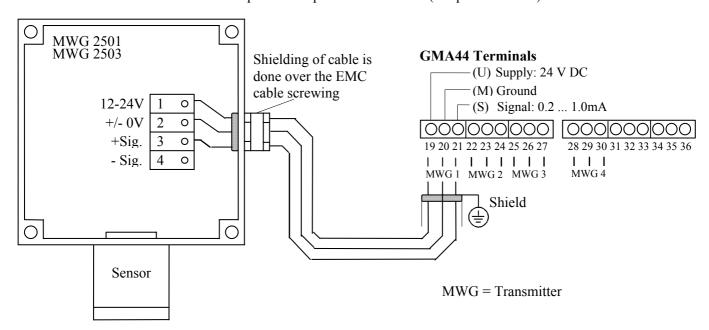

The EC sensors MWG 2502 and 2504 are designed as 2-wire transmitters. The 4 - 20mA output signal is provided via the supply line.

For connection of transmitters 2 to 4 repeat the steps for transmitter 1 (see picture below).

#### 0.2 – 1mA output signal

The EC sensors MWG 2501 and MWG 2503 are designed as 3-wire transmitters. The supply voltage and the 0.2 - 1mA output signal use the same ground line.

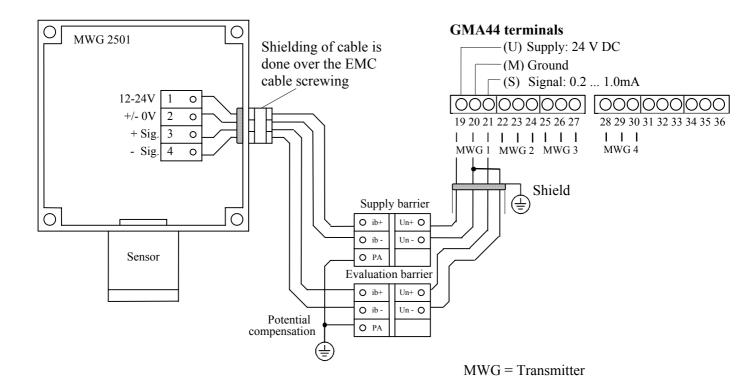

## Transmitter EC25 EX (model MWG 2501) with Ex-barrier

#### 0.2 - 1 mA output signal

The EC sensor MWG 2501 is designed as 4-wire transmitter. Supply and signal lines are separated. The transmitter is considered as 4-pole. For reasons of explosion protection, Ex-barriers are linked between transmitter and GMA44 both in the supply lines and in the signal lines.

For connection of transmitters 2 to 4 repeat the steps for transmitter 1 (see picture below).
